A PROGRAMMER'S VIEW OF COMPUTER ARCHITECTURE: WITH ASSEMBLY LANGUAGE EXAMPLES FROM THE MIPS RISC ARCHITECTURE BY JAMES GOODMAN, KAREN MIL PDF

This introductory text offers a contemporary treatment of computer architecture using assembly and machine language with a focus on software. Students learn how computers work through a clear, generic presentation of a computer architecture, a departure from the traditional focus on a specific architecture. A computer's capabilities are introduced within the context of software, reinforcing the software focus of the text. Designed for computer science majors in an assembly language course, this text uses a top-down approach to the material that enables students to begin programming immediately and to understand the assembly language, the interface between hardware and software. The text includes examples from the MIPS RISC (reduced instruction set computer) architecture, and an accompanying software simulator package simulates a MIPS RISC processor (the software does not require a MIPS processor to run).

Errors, Not helpful

By Chris S

This book not only has a handful of errors but it doesn't explain assembly language like the current programming books do, through easy to follow examples. I had to take a Computer Assembly Language class for college and this book didn't help me once. I graduated with a 3.4 so it's not like I am a bad student or someone who doesn't try, it's just this book doesn't help people learn MIPS. Stay away.

Old but good.

By Macky Cracklins

This is an old book, but it is a good one. All the details of assembly language, number representation and binary mathematics all in one book. There is a list of errata for the book located here:[...]

new edition has not been printed

By comp sci major

Based on the author's review I tried to get a copy of a newer edition than 1993. According to Oxford Press, the newer edition is in press but has not been printed and they have no publication date available.
